

## Product Release

### Automated Pipeline Black Powder Separator

Carbon steel pipelines are subject to corrosion and erosion of the pipe walls. The by-product of these actions is iron oxides and sulfides (down to sub-micron in size) that cause damage to valves, flow meters, pump components and plugs traditional filters.

Automated Self Cleaning Black Powder Magnetic Separators remove iron oxides, silica and iron sulfides from oil—reducing operational costs.

Applications for high and low pressure pumps are available and manufactured for distribution worldwide.

If required, ASME U-Stamp, PED and CRN certified vessels are available.
